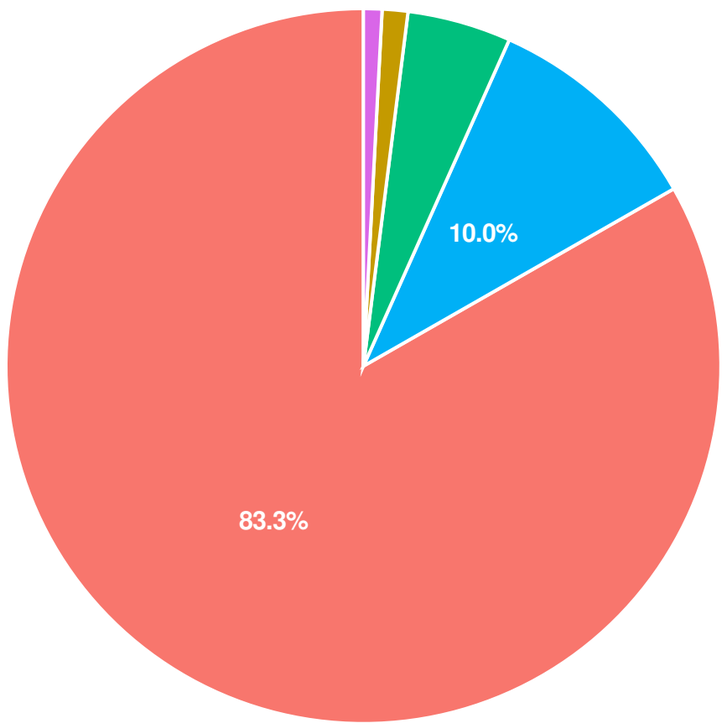
Comparative classification of candidate viral-homologous regions

Initial EEFinder candidates across 19 Culicinae mosquito genomes; categories based on viral and transposable-element reference matches

A

Overall classification of candidate regions

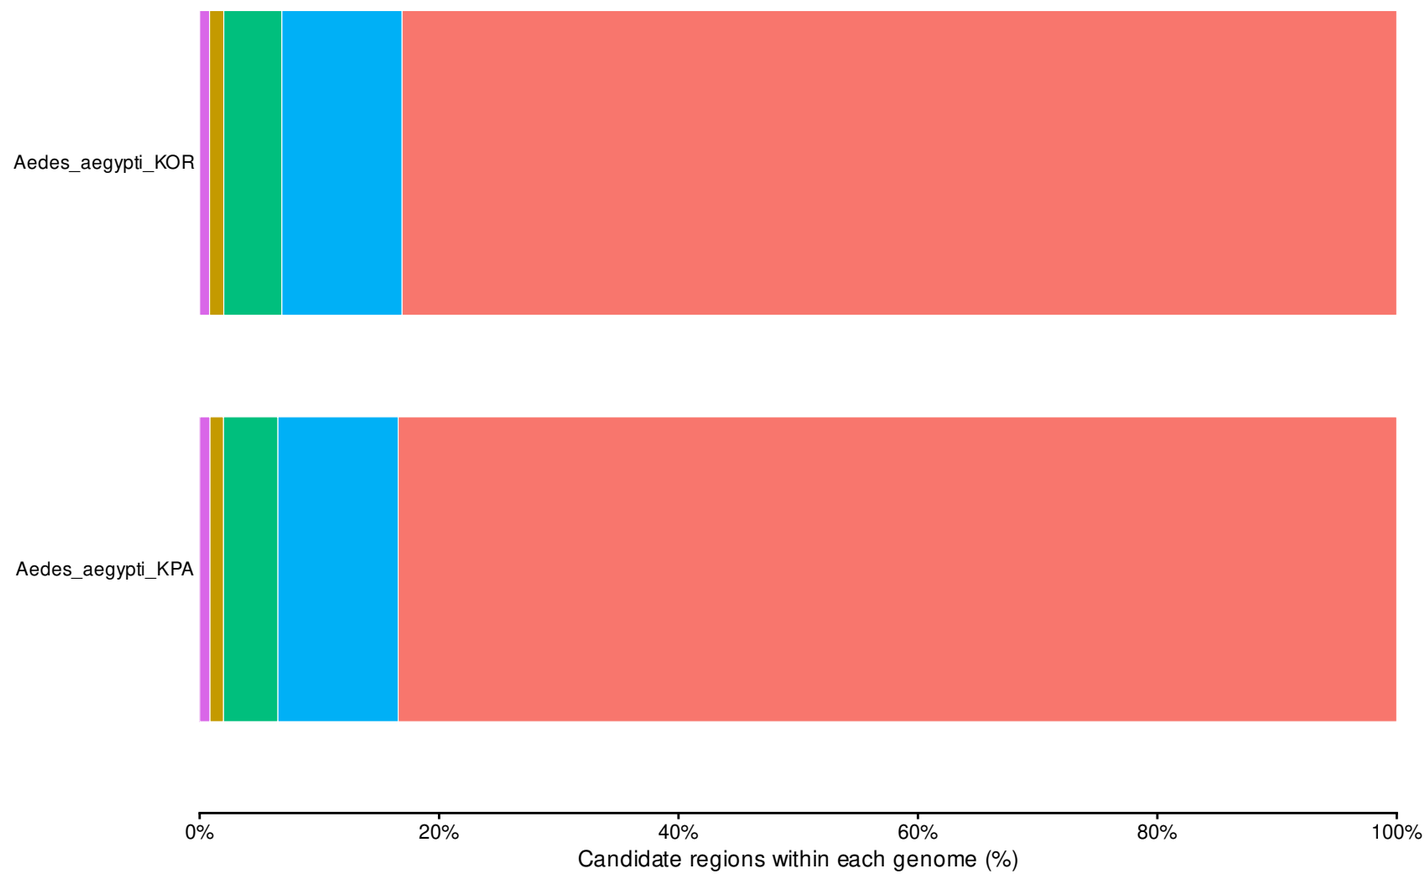


Category: count (percentage)

- LTR retrotransposon-related: 9,470 (83.3%)
- Viral-reference-like: 1,143 (10.0%)
- Other TE-related: 534 (4.7%)
- DNA/other transposon-related: 132 (1.2%)
- No significant protein hit: 95 (0.8%)

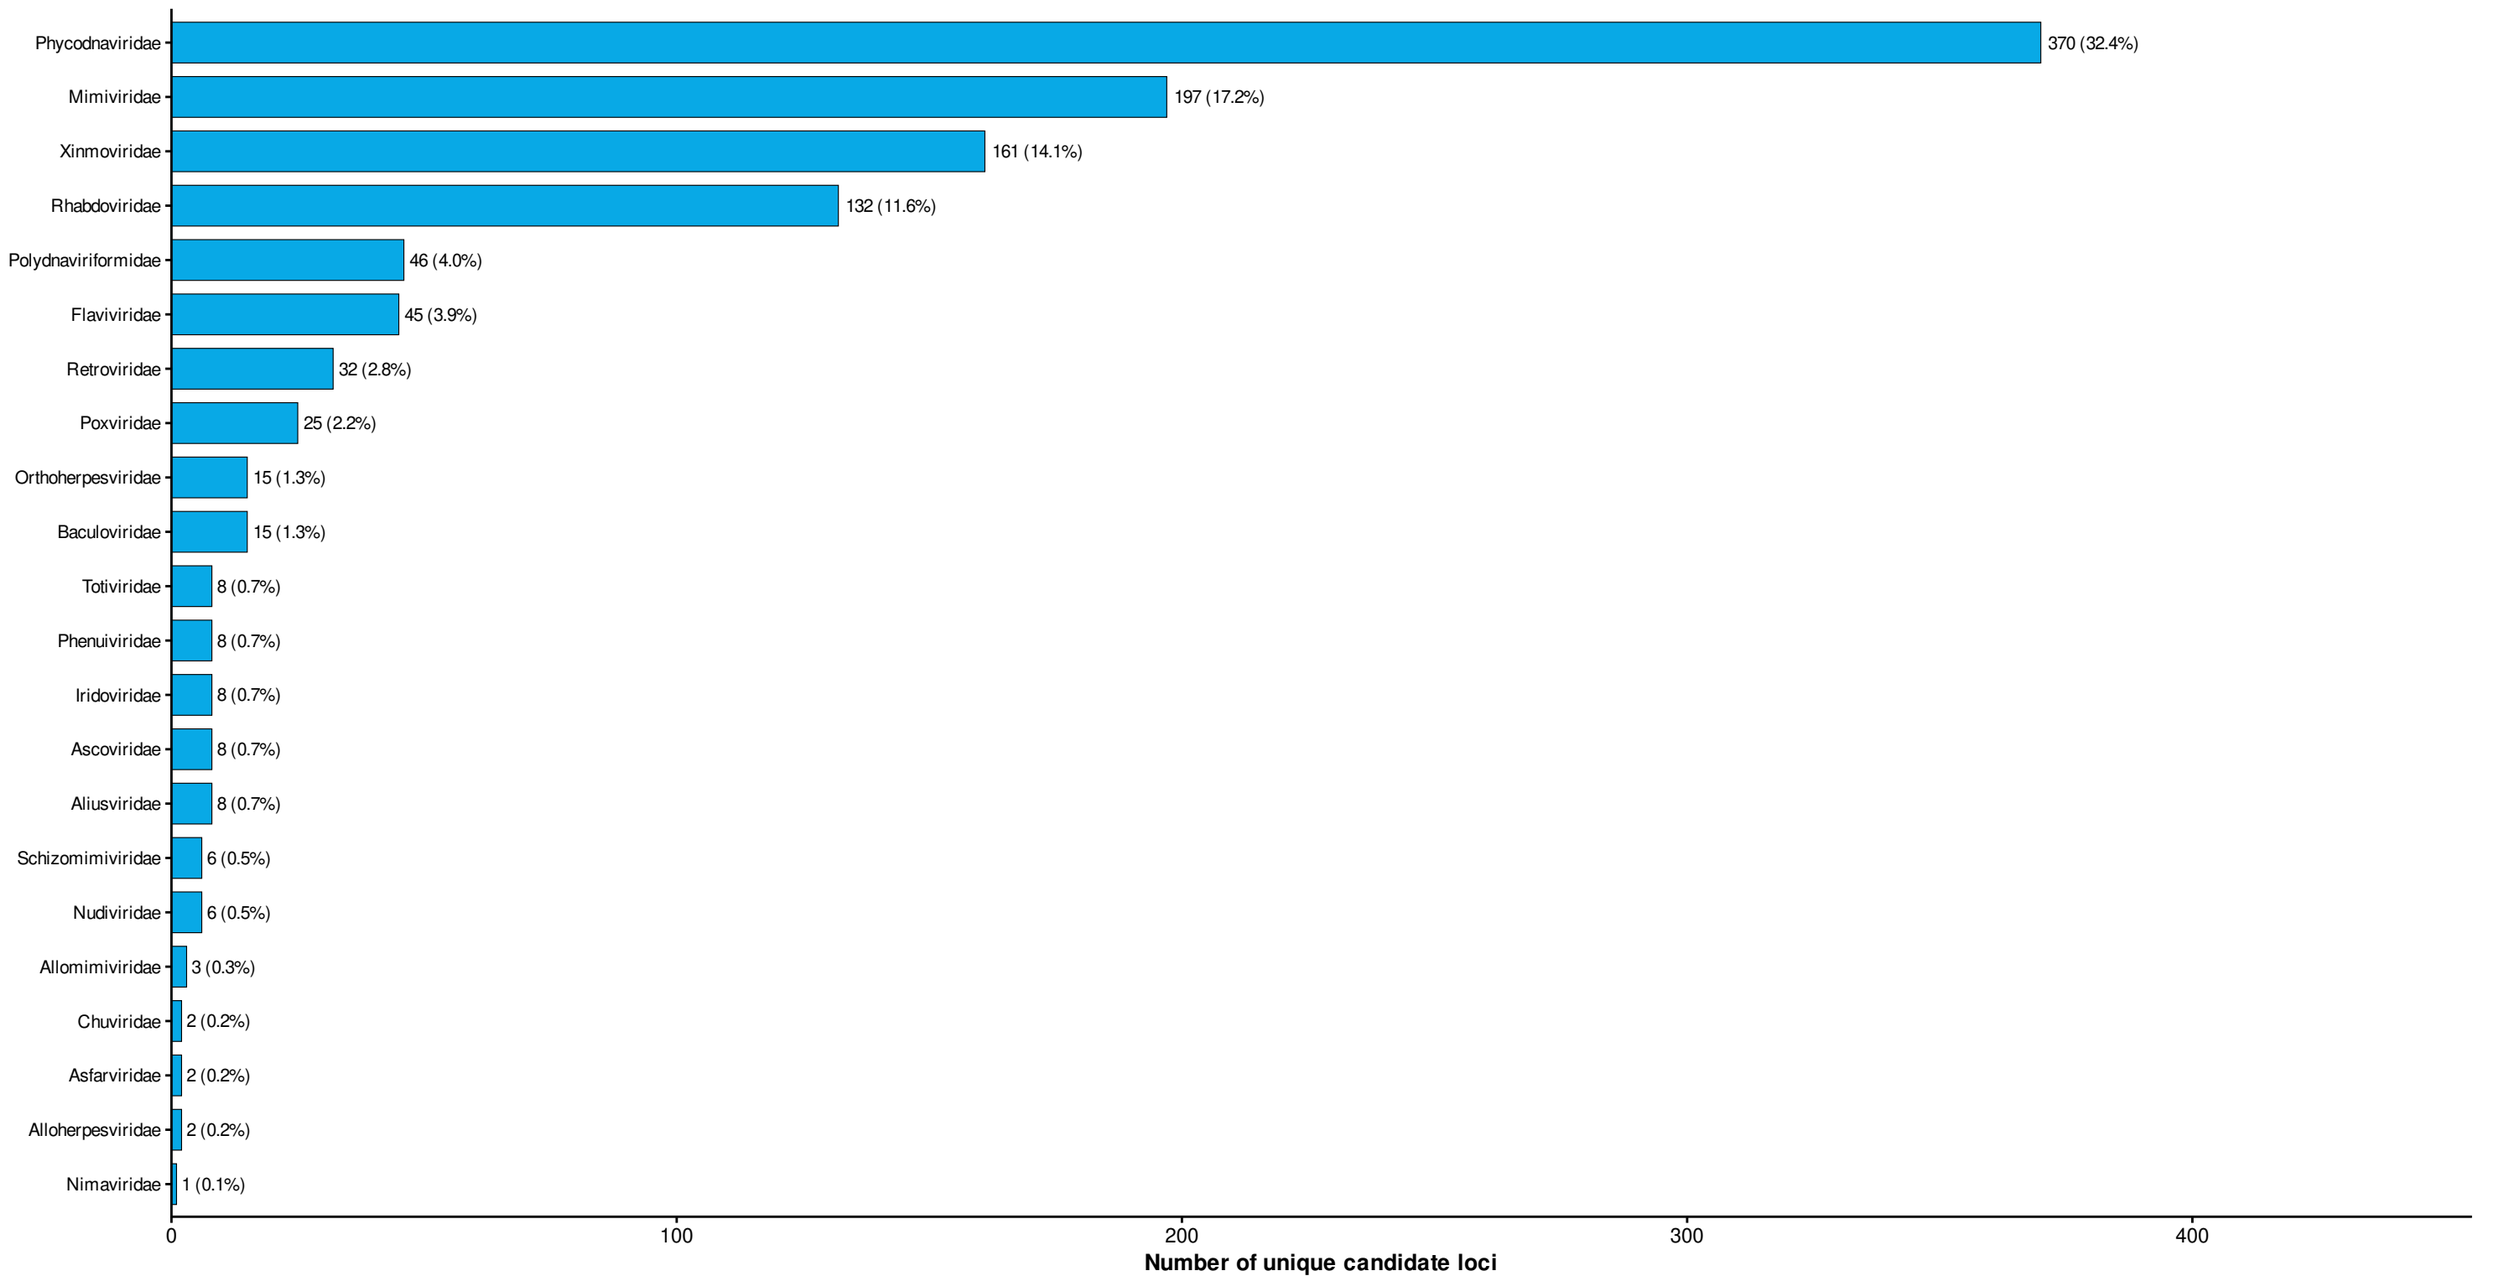
B

Category composition across mosquito genomes



Candidate category

- LTR retrotransposon-related
- Viral-reference-like
- Other TE-related
- DNA/other transposon-related
- No significant protein hit

C


Top 30 family annotations among viral-reference-like candidates (N = 1,143)
